

An Information Technology Update for Small Businesses in Asia Pacific

Small businesses striving to incorporate information technology [IT] into their operations are faced with a daunting array of choices. Complicating their decisions in recent years is a surge in broadband deployment, accompanied by a heightened awareness of security issues. In this whitepaper IntelliClear examines a number of recent technology advances and their impact on small businesses, together with an update on the utility of PCs and their performance in a security-conscious world. IntelliClear was commissioned by Intel Corporation to develop and publish this whitepaper, which represents the views and opinions of IntelliClear without influence or bias to the views and opinions of any vendor or client.

The Purpose of this Whitepaper – Examining Selected Small Business Technology Trends

Asia Pacific-based small businesses (less than 100 people) are becoming robust investors in technology, driving efficiencies and advantages that help them thrive in an increasingly competitive world. Unlike large corporations, small businesses don't often have on-staff experts to study new developments and determine which technologies will provide the highest return on their investments. The purpose of this paper is to provide small business decision makers with valuable insights into the latest technologies found in today's business PCs and the impact of those technologies on the security, data reliability, and efficiency of the small business.

Why Small Businesses are Purchasing Technology at an Ever-Increasing Rate

Using PCs can help small businesses reduce overall operating costs, be more competitive, and grow. AMI-Partners, a New York based research firm specializing in

the global Small and Medium Business (SMB) market, reported in June, 2005 that "through adoption of IT and communications technologies and solutions, SMBs have emerged from a competitive disadvantaged stage during much of the 1990s to a level playing field today" versus large corporations. AMI states that as small businesses move to higher levels of IT adoption, "they seem well poised to evolve to a competitive stage with larger enterprises, due to a combination of IT and Web-enabled solutions, characteristic agility, and organizational efficiencies."¹

AMI "goes on to note that much of the (small business) growth will occur in the Asia-Pacific region...many of which are buying PCs and servers as they build out their IT infrastructure."² According to the Australia Bureau of Statistics (ABS), in June 2004, 71.7 percent of small businesses reported that they were using computers in their business operations.³ Consequently, as the adoption of PCs increases, those small businesses who are delaying the adoption of PCs are facing increasing competitive challenges, business difficulties, and vulnerability to failure.

According to John Madden, Practice Director at Summit Strategies, a Boston-based consulting organization, "Technology investments by SMBs to increase productivity will continue. Small and medium businesses want the technology capabilities of large enterprises to improve their operations, but also because many of their customers and suppliers are demanding it."⁴

"I have a couple of customers who did not use PCs and then recently started to do so. They now have much better visibility to their financials and are able to have a much better idea of where their business is going. This will help productivity and increase their chances for growth," says David Gibbs, Small Business Consultant for the National Australia Bank.

A small business with PCs, broadband access to the Internet, email, and the appropriate business applications can maximize its efficiency and ability to manage the business no matter what industry it operates in. Small businesses that embrace the latest in information technology will clearly out-manuever those that don't,

having a distinct advantage in capturing on-going commerce opportunities.

"With PCs your efficiency increases, business cycle time decreases, and you will have more productivity," says Shri Bhavin Kadakia, Executive Director of IT for the Indian Merchant Chamber of Commerce. Mr. Kadakia's comments remind us that for a small business, the centerpiece of a viable competitive and operational strategy is the PC. From the development of flyers and other demand-generating marketing materials, to the use of accounting software and spreadsheets for financial analysis and on-going process improvement, well-performing PCs enable small businesses to manage their operations more effectively.

Security Threats and Viruses Should be Taken Seriously, but Should Not Delay the Adoption of PCs

According to the IDC study *Diving into the Demand of Solutions Among Asia/Pacific Small and Medium-Sized Business*, "SMBs in Asia/Pacific are most concerned about their security arrangements, in terms of investments. The never-ending launches of viruses and external threats are top probable reasons causing security solutions to become top priority among the respondents."⁵ For small businesses using PCs, security threats such as viruses and hacker attacks can seriously disrupt computer-based business operations. For that reason, it's important for small businesses to be proactive about keeping security and application software up-to-date to minimize potential disruption of their business.

"I agree whole-heartedly that viruses and hackers can create big issues for businesses that use PCs. They need to be paranoid about this," says Teo Chee Hai, past President of The Institute of Surveyors in Malaysia, a national professional organization where a majority of its membership in the private sector are small businesses.

Up-to-date security software is a key element of an optimized security infrastructure. Regular updates can be facilitated through software subscriptions with manual and/or automatic updating capabilities. A more effective method available to small businesses is the use of Intel®

Active Management Technology (Intel® AMT), now built-into some PCs that utilize Intel® processors. Intel AMT allows technology support providers to proactively check and update software remotely from a central location.

Despite the anxiety to small businesses, viruses and other security threats should not delay the adoption of PCs. "Viruses are a part of business life and need to be avoided. Many have been successful in doing so; therefore there must be a method to accomplish this. This issue should not affect a small business' decision to purchase PCs," says A. Barve, Assistant Secretary General of the India Electrical and Electronics Manufacturers Association, which includes over 300 small businesses.

Symantec Corporation recently counseled small businesses: "Even the smallest of businesses are not immune to Internet threats... The introduction of new technologies, along with the increasing sophistication of Internet threats, calls for a defensive in-depth solution."⁶ A comprehensive security strategy is achievable by small businesses and includes hardware, software, and policies that address common points of vulnerability.

Buffer Overflow Viruses and Worm Attacks are Common but Can be Prevented

According to a March, 2005 Internet Security Threat Report by Symantec Corporation, buffer overflow attacks, such as the now infamous "Slammer" and "Blaster" outbreaks, were the third most common attack in the 2nd half of 2004 and appear to be on the rise today.⁷

Effective protection against these attacks can be found today within the PC itself. Execute Disable Bit, a built-in feature of Intel® processors, works with Windows* XP Service Pack 2 to guard against the entire class of viruses and worms that infect computers using this "buffer overflow" technique. The Bit prevents this malicious software from executing and possibly propagating to the network and other computers.

"These viruses can be easily avoided by using the latest vaccines. Intel provides these disabling features making it absolutely possible to prevent these viruses from harming

your small business,” says Shri Bahvin Kadakia. Saiful Hizam, Assistant Manager of the Bank Islam in Malaysia serving a large number of small businesses adds: “Preventing buffer overflow and other viruses is indeed important.... (Viruses) can lead to inaccurate data and incorrect business transactions – things that can cause headaches to a small business.”

Other Tips and Technologies for Maintaining a Secure Environment

While security and anti-virus software is crucial in protecting a small business from disruption, it is ineffective if it interferes with the user’s ability to get their job done, or fails to operate due to user intervention.

“This is very important - what happens is many small businesses still use Intel® Pentium® 2 or 3 generation technology (and) their hardware may not keep up with the latest anti-virus software.” says Shri Bahvin Kadakia.

While PC performance is critical in keeping small business employees productive, it is also critical in keeping small business employees from tampering with security software. “It’s important to keep users from messing with security software and PC configurations... unless you have the ability to lock down the desktop you will suffer from individuals changing settings,” says Adrian Rose, State Manager of the Small Business Trade Association of Australia in Sydney.

Microsoft, in a May 2005 support article, comments that turning off virus protection and/or firewalls can leave systems vulnerable to and unprotected against virus attacks and infections.⁸

The issue of performance and security software tampering can be managed by ensuring users are provided with PCs that can adequately perform under the strain of virus scanning and other security related computing overhead. Small businesses shouldn’t underestimate the overhead that state-of-the-art security software can put on a PC. Squeezing an additional one to two years out of a two to three year PC life-cycle may not be a wise choice and could result in lost productivity. Small businesses should

insist on PCs that are designed for business and are equipped with processors that provide plenty of head room for growth and security software overhead.

With so much attention on PC security, it’s easy to forget about the issue of basic user access rights and authentication. The ability to control business access to files and networks, to those with need-to-know rights and the skills to handle the data, is critical so as to ensure privacy of employee and customer data, avoid sabotage, and reduce the potential issues in case of physical theft of computers. Symantec urges businesses to restrict and control network access by maintaining and enforcing firm policies.⁹

According to an AMI SMB study in 2004 a large percentage of SMBs were expected to hire new employees within a 12-month period.¹⁰ With the upswing in new recruits comes the vulnerability associated with more users, more access, and an increase in the potential for malicious activities.

“In each and every small business this should be done (deploying controlled user access rights technology). Users should only have access to that which they need”, says Bahwin Kadakia.

The Role of External Service Providers

Capitalizing on the widespread attention focused on security, a variety of vendors and service providers are offering products and services to help prevent infections and security breaches, giving small businesses a multitude of choices in protecting their business. “...Service providers can do a lot to help small businesses... I think it would happen naturally as service providers learn better how to work with small businesses,” says Saiful Hizam.

Service providers play a critical role in ensuring small businesses are adequately protected, and receive help to quickly recover in the event a breach does take place. Market research firm, AC Nielsen, reports that “a growing number of SMBs in the United States are turning to a trusted service provider to design, install, and maintain their security solutions.”¹¹ In a 2004 study in North

America, research firm Infonetix reported that “more than 38 percent of small businesses and 50 percent of medium-sized businesses get one or more of these essential security functions - virus scanning, firewall, authentication, VPN client, and intrusion detection and prevention - from a service provider.”¹² IntelliClear believes that these same service provider trends will evolve in the Asia Pacific Region at an increasingly accelerated pace.

With the help of a service provider, small businesses can develop a comprehensive security strategy utilizing existing capabilities of the operating system, and hardware components found in business-class PCs. Experienced service providers can also evaluate information access policies and procedures to uncover physical vulnerabilities, and recommend additional security software if necessary.

Businesses should look for service providers that have remote support capabilities that allow them to examine, troubleshoot, and repair systems over the network. Remote support capabilities provide small businesses with not only timely resolution of problems, but potential cost savings due to fewer on-site technical service visits. Large corporations have been using remote management capabilities for years to support their IT infrastructures, reduce costs, and preserve precious IT resources.

These remote services are extending to the management of software environments. Features that enable service providers to assess and update software on networked PCs can help keep security software up-to-date; allow for the understanding of what software is installed to advise on its ability to handle business growth; identify how many copies of software are in use in order to minimize licensing costs; and identify which versions of software are installed in order to assess the PC's capability to meet regulations for privacy and accurate financial reporting.

In the past, remote services were limited by an inability to operate on PCs that were powered off or were unable to boot. Intel AMT, overcomes that limitation by providing the ability to diagnose problems, replace system files, update security software, and restore systems to normal operation even when the PC is turned off or the operating

system cannot be started. This capability is available only in systems using Intel chips.

These remote service provider operations are likely to become more common as broadband becomes ubiquitous and Internet-based services reach the mainstream. As this happens, remote management of PCs will be a valuable service for small businesses. With respect to remote PC management David Gibbs comments: “(Remote PC Management) would be great for a small business. This could help solve issues more promptly and maybe save costs. I think small businesses will grab this with both hands.”

A Second Hard Disk – Simple Insurance for Data Protection

For data protection, having a second hard drive in a PC continuously copying information from the primary hard drive can be invaluable. This feature can provide data redundancy in the event of a system or hard drive failure. Until recently, this capability, known as “disk mirroring,” required a special add-in card and software. But this year Intel has begun building this feature, called Intel® Matrix Storage Technology, into chips used in business-class PCs.

“I believe that using a second hard drive is an economic back-up solution... there is a reasonable cost for this. Automatic back-ups that are easier to perform would be helpful.” says A. Barve.

Voice Over IP (VoIP) Enabled Through a PC, Delivering a Better Telephone

Voice over IP (VoIP) technology sends telephone calls over the Internet, often at substantially lower costs than regular telephone calls. Worldwide SMB IP Telephony VoIP spending is expected to grow at a CAGR of 41 percent from 2003 to 2008, reaching an estimated total spending in 2008 of \$4.5 billion according to AMI.¹³ Many small businesses have already surmised that cost savings and efficiency gains are just the start of how VoIP can benefit their business.

One particular implementation of VoIP is the use of “PC soft-phones,” software that acts like a telephone and runs on a PC. PC soft-phones using VoIP (e.g. services such as Skype*) can help businesses serve their customers better and operate more efficiently by streamlining communication, reducing costs, while enjoying high-fidelity voice quality on PC-to-PC phone calls.

“If the quality can perform, and costs can be saved, then VoIP (Internet-based Phones) will be pursued by many small businesses,” says Teo Chee Hai.

Conclusions – Educate, Plan, and Invest

The opportunities for small businesses to improve their operations through the effective use of information technology - mainly the new breed of business PCs equipped with advanced Intel processors - are enormous and multi-dimensional. A number of valuable new technologies relating to security, remote support, reliable data redundancy, and VoIP have been recently introduced and will help small businesses capture these opportunities through disciplined education, planning, and investment. By working with solution providers small businesses can deploy these technologies and gain the benefits associated with ongoing effective technology usage.

IntelliClear recommendations:

1. Keep security software up-to-date.
2. Maintain optimal security including anti-virus software, Microsoft* Windows* XP Service Pack 2, and Intel's built-in Execute Disable bit technology.
3. Choose PCs that are designed for business, with performance enough to prevent security software from interfering with user computing tasks.
4. Select a service provider who can help with security and remote computer support.
5. Insist on PCs with Intel® Active Management Technology for better remote support.

IntelliClear recommendations (continued):

6. Protect business information with Intel® Matrix Storage Technology and a second hard drive.
7. Deploy PC-based VoIP to reduce costs and increase business efficiencies.

About IntelliClear (www.intelliclear.com)

IntelliClear is a market research and business consulting firm committed to the delivery of actionable market intelligence to the global IT community. IntelliClear's mission is to bring clarity to IT market intelligence by delivering results-oriented research, responsive industry experience, and effective data synthesis - leading to confident go-to-market plans. IntelliClear leverages the experiences of seasoned IT and market research professionals, while utilizing its global network of industry consultants and research partners to execute projects across a broad spectrum of disciplines and geographies.
